# Smart Contract Audit Report

# ABOUT AUDITACE

Audit Ace is built, to combat financial fraud in the cryptocurrency industry, a growing security firm that provides audits, Smart contract creation, and end-to-end solutions to all crypto-related queries.

# Overview

AUDITACE team has performed a line-by-line manual analysis and automated review of smart contracts. Smart contracts were analyzed mainly for common contract vulnerabilities, exploits, and manipulation hacks.

Token Name: CondorChain (CDR)

Contract address 0xf5930e4a767657e547C621F6c05b108b1e721614

Audit Result: Passed

Audit Date: October 08, 2022

KYC :Not Done till Date of Audit

Audit Team: TEAM AUDITACE

# Token Summary

Parameter	Result
Address	0xf5930e4a767657e547C621F6c05b108b1e721614
Token Type	ERC 20
Token Tracker	CondorChain (CDR)
Decimals	9
Supply	50,000,000
Platform	Binance Smart Chain
Compiler	v0.8.17+commit.8df45f5f
Contract Name	Condor Chain
Optimization	Yes with 5000 runs
License Type	MIT
Language	Solidity
Codebase	<a href="https://bscscan.com/address/0xf5930e4a767657e547C621F6c05b108b1e721614#code">https://bscscan.com/address/0xf5930e4a767657e547C621F6c05b108b1e721614#code</a>

The screenshot shows a Visual Studio Code editor window titled 'HasWBNB.js - backend contact checker - Visual Studio Code'. The Explorer sidebar on the left displays the project structure for 'Vitalik-Platform-Contract-Checker-backend.zip', with 'honeycheck.js' selected under the 'honeycheckers' directory. The main editor area shows the content of 'honeycheck.js', which is a JavaScript file using ethers.js to interact with a DEX (Uniswap V2) to buy gas.

```

1  const { ethers, network } = require("hardhat");
2
3  const HasWBNB = async (token, signer, signerAddress, Dex, ethAddress) => {
4    let buyGas;
5    let sellGas;
6    let tokenName = await token.symbol();
7    const toGet = {
8      await Dex.getAmountsOut(ethers.utils.parseEther("1"), [
9        ethAddress,
10       token.address,
11     ])
12   };
13   console.log("Expect To Get " + toGet);
14   const pn_buy_tx =
15     await Dex.swapExactETHforTokensSupportingFeeOnTransferTokens(
16       0,
17       [ethAddress, token.address],
18       signerAddress,
19       Date.now() + 1000 * 60,
20       {
21         value: ethers.utils.parseEther("1"),
22         gasPrice: await ethers.provider.getGasPrice(),
23         gasLimit: "1000000",
24       }
25     );
26   const buy_rec = await pn_buy_tx.wait(1);
27   buyGas = buy_rec.gasUsed;
28   console.log("• Bought...");
29
30   let added = (await token.functions.balanceOf(signerAddress)).balance;
31   let buyTax = toGet
32     .sub(added)
33     .mul(10 ** 4)
34     .div(toGet);
35   buyTax = parseEther(buyTax) / 100;
36   console.log("Buy Tax : " + buyTax);
37   await network.provider.send("evm_increaseTime", [5]);

# AUDIT METHODOLOGY

The auditing process will follow a routine as special considerations by Auditace:

- Review of the specifications, sources, and instructions provided to Auditace to make sure the contract logic meets the intentions of the client without exposing the user's funds to risk.
  - Manual review of the entire codebase by our experts, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - Specification comparison is the process of checking whether the code does what the specifications, sources, and instructions provided to Auditace describe.
  - Test coverage analysis determines whether the test cases are covering the code and how much code is exercised when we run the test cases.
  - Symbolic execution is analysing a program to determine what inputs cause each part of a program to execute.
  - Reviewing the codebase to improve maintainability, security, and control based on the established industry and academic practices.
-

# Issues Checking Status

No	Issue Description	Checking Status
1	Compiler warnings.	Passed
2	Race conditions and Reentrancy. Cross-function race conditions.	Passed
3	Possible delays in data delivery.	Passed
4	Oracle calls.	Passed
5	Front running.	Passed
6	Timestamp dependence.	Passed
7	Integer Overflow and Underflow.	Passed
8	DoS with Revert.	Passed
9	DoS with block gas limit.	Passed
10	Methods execution permissions.	Passed
11	Design Logic.	Passed
12	Cross-function race conditions.	Passed
13	Safe Zeppelin module.	Passed
14	Malicious Event log.	Passed
15	Scoping and Declarations.	Passed
16	Fallback function security.	Passed
17	Arithmetic accuracy.	Passed

# SWC ATTACK TEST

SWC ID	Description	Test Result
SWC-100	Function Visibility	Passed
SWC-101	Integer Overflow and Underflow	Passed
SWC-102	Outdated Compiler Version	Passed
SWC-103	Floating Pragma	Passed
SWC-104	Unchecked Call Return Value	Passed
SWC-105	Unprotected Ether Withdrawal	Passed
SWC-106	Unprotected SELFDESTRUCT Instruction	Passed
SWC-107	Re-entrancy	Passed
SWC-108	State Variable Default Visibility	Passed
SWC-109	Uninitialized Storage Pointer	Passed
SWC-110	Assert Violation	Passed
SWC-111	Use of Deprecated Solidity Functions	Passed
SWC-112	Delegate Call to Untrusted Callee	Passed
SWC-113	DoS with Failed Call	Passed
SWC-114	Transaction Order Dependence	Passed
SWC-115	Authorization through tx.origin	Passed
SWC-116	Block values as a proxy for time	Passed

SWC ID	Description	Test Result
SWC-117	Signature Malleability	Passed
SWC-118	Incorrect Constructor Name	Passed
SWC-119	Shadowing State Variables	Passed
SWC-120	Weak Sources of Randomness from Chain Attributes	Passed
SWC-121	Missing Protection against Signature Replay Attacks	Passed
SWC-122	Lack of Proper Signature Verification	Passed
SWC-123	Requirement Violation	Passed
SWC-124	Write to Arbitrary Storage Location	Passed
SWC-125	Incorrect Inheritance Order	Passed
SWC-126	Insufficient Gas Grieving	Passed
SWC-127	Arbitrary Jump with Function Type Variable	Passed
SWC-128	DoS With Block Gas Limit	Passed
SWC-129	Typographical Error	Passed
SWC-130	Right-To-Left-Override control character (U+202E)	Passed
SWC-131	Presence of unused variables	Passed
SWC-132	Unexpected Ether balance	Passed
SWC-133	Hash Collisions with Multiple Variable Length Arguments	Passed
SWC-134	Unencrypted Private Data On-Chain	Passed

# Classification of Risks

## Severity

## Description

◆ <b>High-Risk</b>	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.
◆ <b>Medium-Risk</b>	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.
◆ <b>Low-Risk</b>	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.
◆ <b>Informational</b>	A vulnerability that has an informational character but is not affecting any of the code.

# Findings

## Severity

## Found

◆ <b>High-Risk</b>	0
◆ <b>Medium-Risk</b>	0
◆ <b>Low-Risk</b>	0
◆ <b>Informational</b>	0
<b>Total</b>	0

# MANUAL AUDIT

**NO RISKS FINDINGS**

# AUDIT FINDINGS

- No proxy contract found
- Owner is not able to blacklist an arbitrary wallet
- Owner is not able to mint new tokens
- Owner is not able to pause the contract
- Owner can set fees upto 5%
